

How to disable or enable JavaScript in your browser

Almost all modern browsers have JavaScript installed and enabled by default. Many features of a website are made possible by JavaScript programs that run in your browser.

Please keep in mind that if you disable JavaScript, websites may not function as intended.

Internet Explorer

- Click Tools in the upper right corner of the browser window.
- Select Internet Options from the dropdown menu that appears.
- In the Internet Options window, click the Security tab.
- In the Security tab, click Custom Level button.
- Scroll down the list and locate Active Scripting.
- Select Disable or Enable to adjust your JavaScript settings.

Google Chrome

- Click Customize and control Google Chrome button in the upper right corner of the browser window.
- Select Settings from the dropdown menu that appears.
- Within the Settings window, click Show Advanced Settings.
- In the Privacy section, click the Content Settings button.
- Under the JavaScript section, choose the settings for your needs.
- Once you have made your changes, click Done button.

Mozilla Firefox

- In the address bar, type “about:config” and press Enter.
- Click the “I accept the risk” button in the center of the screen.
- In the search bar, type “javascript.enabled”.
- Right-click the result named “javascript.enabled” and select Toggle.
- To re-enable it, repeat this exact process.

Safari

- Click Menu button in the upper right corner of the browser window.
- Select Preferences from the dropdown menu that appears.
- Click the Security tab and locate the Web Content section.
- The checkbox next to “Enable JavaScript” toggles if it is on or off.
